

The Energy Solution...

Robin Morris

Electro-Magnetic Energy

This is a pure form of energy generated by the constant spinning of all the planets, Solar Systems and Galaxies within our Universe.

As each planet spins it creates a force of gravitational push/pull energy. For example: our mighty sun generates sufficient gravitational energy to hold all the planets in place within our Solar System.

Our sun's incredible energy also assists to create life on earth in the form of plants and trees and so on, providing infinite energy.

There are many types of energy. Man's probable first experience was the wheel, which was first discovered in Mesopotamia around 3,500 BC.

When this happened, man discovered energy as a source of power, a source of mobility and a way to make life a whole lot easier.

Much later, man realised that energy is the source of everything that ever existed, including us. We are a source of spiritual energy created by divine thought from God who is also a form of spiritual energy but God is divine energy of the purest form.

Energy moves in waves. This is how energy

generates its own momentum. Energy is measured and read in frequency cycles, which we refer to as vibrations. The majority of energy is completely invisible to us.

As an energy force, it was only when man discovered steam that man was able to create locomotion using the energy generated from the steam to drive a set of wheels.

Later of course, oil was discovered and the rest as they say is history – the combustion engine ruled.

This all happened back in 1807 when Francois Isaac de Rivaz of Switzerland used a mixture of hydrogen and oxygen for fuel and so it evolved from there into the highly sophisticated and complex automatic fuel injection engines we have today that are capable of generating speeds in excess of Mach 3.3 or three times the speed of sound.

This was achieved by the '*SR-71 Blackbird*', which is officially claimed as the world's fastest jet powered aircraft.

Of course we then had the '*Space Shuttle Columbia*' reaching speeds of 27,350km/h on re-entry through our atmosphere in 1981 and '*Voyager 1*' that averaged a gob-smacking 62,000km/h.

These are speeds that defy our imagination unless of course you're an astronaut and you've been there, done it...

However, all these elaborate and sophisticated craft have one common denominator – *'fuel'*.

Without the energy source that fuel so adequately provides, these complex engines cannot perform to their full awesome potential.

The base ingredient for everyday fuel of course is oil that is mined in certain areas of the world. It is refined and turned into fuel/petrol in various octanes and this represents the majority of our energy source for mobility.

It is expensive, dirty and difficult to refine. It is heavy and has to be transported in its raw state over long distances. Spillages, which happen way too often, create disaster zones for our environment and nature.

Oil does however provide employment for millions of people worldwide. It is one of the world's largest and wealthiest industries.

Scientists are constantly looking for alternative energy sources because the reality is, the world's oil supplies will not last forever. As much as some of us

course oil for the disaster trail it leaves, threatens the ozone and destroys our environment, there are just as many who love it because of the power it generates in their motor vehicles or provides them with employment.

Fact is – it will eventually dry up.

We desperately need an alternative energy source that is reliable, clean, inexpensive and readily available.

This brings us back to our original '*electromagnetic energy*', which as already mentioned, is the energy source of the Universe.

To create this energy on earth we use magnets. By putting two magnets together a magnetic force of push/pull energy is immediately created.

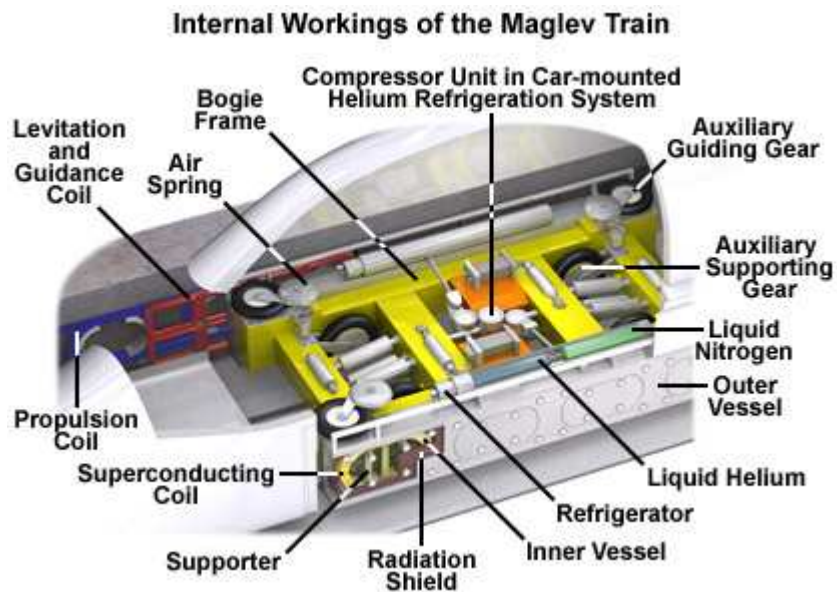

Like poles repel while opposite poles attract.

The Japanese have already created a high speed train working off a magnetic line.

The Maglev Train...

Electricity is used to power the magnets and this is what generates the speed. Less electricity means slower speeds, more electricity equals faster speeds, making the entire operation easily controllable.

How then do we extend this concept to motor vehicles, boats and planes – our source of transport and mobility that we rely on so much for everyday use...?

The answer is actually very simple.

We use a flywheel with magnets embedded in the outer rim of the flywheel. A fixed cylindrical sheath or drum is then placed over the flywheel,

which also contains magnets embedded in the inner rim.

The flywheel magnets are offset slightly behind the fixed cylinder magnet positions. As soon as you drive electricity through the fixed cylinder magnets the flywheel is immediately set in motion, in a low friction environment, due to the push/pull effect of the magnets. This would be similar to a low friction Gyroscope in effect, with perfect balance.

Increase the electricity power and the flywheel speeds up. Reduce the power and the flywheel slows down. You have control.

If the flywheel is fixed to a drive-train that turns an axle then you have a magnetic system that can power a car or a boat or even a propeller or jet/ rotary engine for a plane.

Jet engines work equally as well on boats and

they save our marine life because sharp propellers currently slice up dolphins and whales that get too close.

Battery Power

The source of electricity would have to be from high powered batteries. Batteries today have come a long way. The old acid battery no longer has any credo.

Today, scientists are experimenting with '*Ultra Batteries*' made from Xenon and Fluoride. This battery was developed by placing Xenon Difluoride (a white crystal often used to etch silicon conductors) in a tiny diamond anvil cell (measuring two inches by three inches).

The cell squeezes the Xenon Difluoride molecules to a million atmospheres of pressure (the same amount of pressure found halfway to the center of our planet). This triggers the molecules and stores mechanical energy from the compression process as chemical energy. This can then be used in any number of applications.

There are several advanced battery types, some are currently in use while others are still in the

development stage.

Corvus Energy, a company who specialises in batteries, transformed the marine, transportation and energy industries with its release of an advanced lithium-ion battery technology, able to store and distribute energy in megawatt sizes with the capacity to output sustained power comparable to diesel engines in hybrid and full-electric marine vessels and vehicles.

What this means is that there will always be sufficient power available to generate adequate electricity to drive a magnetically driven energy efficient flywheel connected to an axle.

The addition of solar panels on car roofs, boat decks and airplane wings will ensure additional power is sourced.

Wind tunnels can also be used. This is done with a simple fan enclosed in a tunnel that spins every time the vehicle moves.

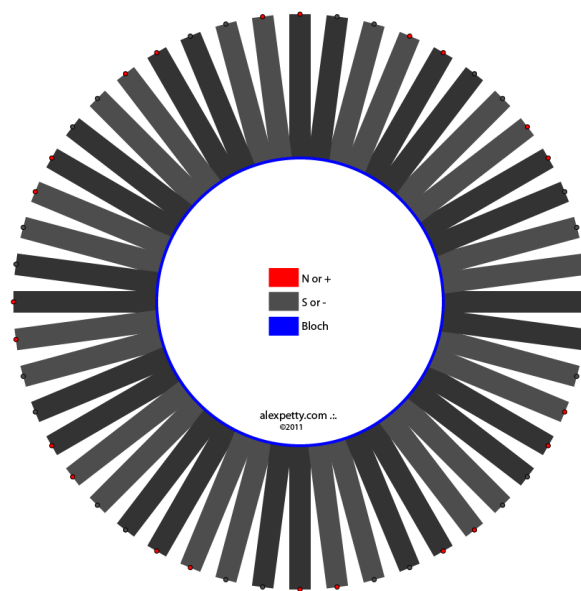

A Basic Wind Tunnel Structure...

The faster the vehicle moves the faster the fan spins. The fan is connected to a generator, which then keeps the batteries constantly powered.

Now we have a magnetically driven engine that can run infinitely. It requires no fuel and therefore no expense to run. It is also CO2 emission friendly and makes absolutely no noise.

Complete stealth.

A fully Integrated Magnetic Flywheel

By Alexander Petty

The above image provides an easier to understand view of the magnetic polarity effect formed by magnets on a flywheel.

The day is coming when all fossil type fuels will be a thing of the past. Magnetic energy will be the source of all mobile energy on planet earth.

It will save our already vanquished planet from further damage and become an effortless way of travel, including intergalactic travel...
